Purpose

The Central Arkansas Regional Transportation Study (CARTS) was established by resolution of the Metroplan Board of Directors in 1992, replacing the Pulaski Area Transportation Study (PATS). The passage of the Intermodal Surface Transportation Efficiency Act (ISTEA) in 1991 was the catalyst for the change. The study area increased from 319 square miles under PATS to 1,531 square miles and portions of four counties, Faulkner, Saline, Lonoke and Pulaski, under CARTS. The CARTS study area was expanded to 2459 square miles in 2011 to include all of Faulkner, Pulaski, and Saline Counties, as well as additional portions within Lonoke County. The current study area is shown in Figure 1 below. The first major product of CARTS came in 1995 with the publication of METRO 2020, the long-range metropolitan transportation plan. METRO 2020 articulated a vision for transportation development in the area for the next 25 years. METRO 2030.2, a revised version of METRO 2030 published in 2010, is the latest transportation plan for central Arkansas.

The CARTS Annual Report serves to inform cooperating agencies, public officials, community leaders, and concerned citizens of the status of current transportation issues, activities, and accomplishments of the local transportation planning process. Additionally, the report includes a variety of transportation and socioeconomic data.

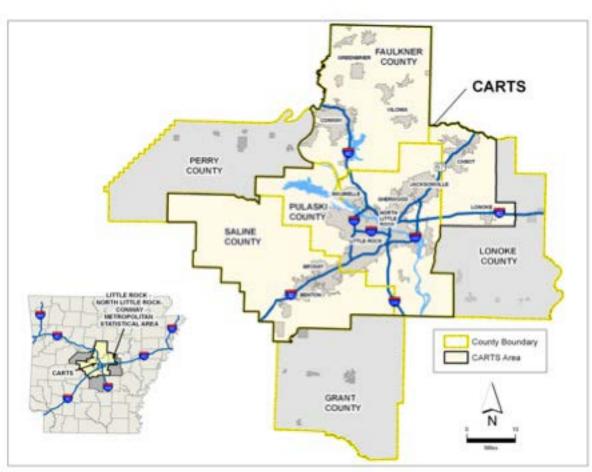

FIGURE 1: CARTS STUDY AREA

Organizational Arrangements

CARTS is the cooperative effort by participating communities, transportation providers and other interested parties to develop a long-range transportation plan for the North Little Rock-Conway metropolitan area.

Metroplan Board

Metroplan is the designated metropolitan planning organization (MPO) under Title 23 of the United States Code (see specifically section 134 on metropolitan planning) for the LR-NLR-Conway Metropolitan Statistical Area (MSA) and has been since 1972. The Metroplan Board of Directors (also known as the MPO Board) consists of elected officials or delegates from general purpose political jurisdictions with a weighted vote based on each jurisdiction's population relative to the total population of all member governments. The only exceptions are the Arkansas State Highway Department (AHTD) and the Central Arkansas Transit Authority (CATA), which sit as special members on the Board for transportation issues.

Regional Planning Advisory Council

In September 1993, the Metroplan Board appointed 40 members to a newly created Transportation Advisory Council (TAC). In 2011, the Metroplan Board approved the renaming of the TAC to the Regional Planning Advisory Council (RPAC) and reconstituting all of the members. The RPAC is broadly representative of the geographic areas within central Arkansas and the various groups with an interest in transportation. The RPAC is charged by the MPO Board with developing the long-range transportation plan and with ongoing public involvement in the transportation planning process. The TAC was instrumental in developing METRO 2020, METRO 2025, METRO 2030 and the recently completed METRO 2030.2. The members of the TAC prior to reconstitution are shown in the table below.

Technical Coordinating Committee

The Technical Coordinating Committee (TCC) is made up of member government's technical staff or representative. The TCC is in charge of developing the unified planning work program (UPWP), Transportation Improvement Program (TIP) and providing technical support to the TAC and MPO.

Study Area Activities and Accomplishments

1999

- Regional bikeway plan developed
- Dave Ward Drive Access Management Plan
- I-630 study completed

2000

- METRO 2025 adopted
- Metroplan received the National Award for Outstanding Leadership in Metropolitan Transportation Planning from the Association of Metropolitan Planning Organizations

2001

- Ozone Flex Program
- Rural Traffic Shed Management Study
- Regional Arterial Network Study

2002

- Incident Management Study adopted
- Intelligent Transportation System included in METRO 2025
- Regional Arterial Network (RAN) study completed by consultants

2003

- Began public outreach activities for METRO 2030
- CARTS area remained in attainment for air quality
- Consultant team chosen for METRO 2030

2004

- South Loop study initiated
- River Rail trolley system opened
- Mid-Arkansas Water Alliance requested allocations from Army Corps of Engineers for Lake Ouachita and Greer's Ferry Lake

2005

- METRO 2030 adopted
- Consultant team chosen for South Loop study
- Roadway analysis conducted for I-30 study
- CARTS remained in attainment for air quality

2006

- Revised CARTS Public Participation Plan
- Big Dam Bridge Opens
- Riverdale Traffic Study Initiated
- Alcoa Road Access Management Plan Adopted
- South Loop Feasibility Study and Environmental Analysis Conducted

2007

- CARTS Design and Access Management Standards adopted
- CARTS Public Participation Plan (revised) adopted
- CARTS Pedestrian/Bicycle Decade (1995-2005) Crash Analysis completed

2008

- I-630/I-430 Interchange Design Concept approved
- LR Airport Rail Study initiated
- Northbelt Freeway Supplemental EIS finalized by AHTD
- Conway Transit Feasibility Study initiated
- Northbelt Freeway Record-of-Decision (ROD) received

2009

- Census tract and traffic zone boundaries approved for 2010 Census
- Operation Bottleneck undertaken
- TAC decides to pursue update of METRO 2030 as METRO 2030.2
- CARTS Design and Access Management Standards amended to include "Sharrows" markings for bicycles
- I-630 Fixed Guideway Alignment Study consultant selected and scope of work developed
- CARTS Z-Card Bicycle Ride Map published
- ARRA Funded projects selected/ programmed

2010

- METRO 2030.2 adopted
- Conway Transit Feasibility Study completed
- All ARRA/STP Funds successfully obligated

2011

- CARTS designated with Preferred Sustainability Status by HUD/EPA
- River Rail Phase II Study initiated
- ITS Plan updated
- North Little Rock and Conway roundabouts opened
- I-430/I-630 Phase III construction let
- RAN Status Update published
- Green Agenda adopted
- Consultant selected for travel demand model update

- Clinton Presidential Park Bridge construction initiated
- Two Rivers Park Bridge construction completed
- Traffic analysis zone and district delineations submitted to Census Bureau
- CARTS study area expanded
- CATA installed new GFI Fareboxes on all buses and streetcars
- CATA purchased 10 new buses and 8 new Paratransit vehicles
- CATA in final construction stages of the new trolley barn
- CATA Paratransit staff and service expanded
- CATA added new streetcar stop at 2nd and Rock in Little Rock

2012

- Completion of widening I-40 to six lanes between Little Rock and Conway
- Completion of widening US Hwy 67 to six lanes through Jacksonville to Cabot
- Improvements to I-30 connecting Little Rock and North Little Rock, including widening the I-30 Arkansas River Bridge
- Continuation of widening I-630 in Little Rock from Baptist Hospital to Fair Park Blvd.
- Completion of widening US Hwy 64 to four lanes between Conway and Beebe
- Continuation of widening I-30 to six lanes between Benton and Highway 70
- Widening of US Hwy 70 to four lanes between I-30 and Hot Springs

Area Characteristics

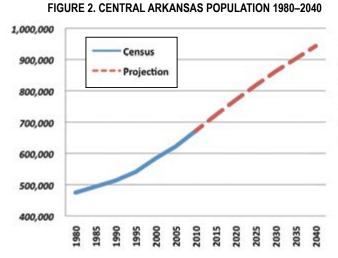

Population

U.S. Census data provide the basis for the CARTS area population. Metroplan supplements census figures with annual population estimates to cover the period between each decennial census. Population data are used in transportation planning to estimate travel demand, identify growth areas, or define the scale of a study area.

The CARTS area is shown in Figure 1. CARTS includes that portion of the MSA (Metropolitan Statistical Area) which is officially designated by the U.S. Office of Management and Budget (OMB) as the urbanized area, plus the area expected to become urbanized during the 25-year planning period. During 2011, Metroplan officially enlarged the CARTS area, taking in remaining portions of Faulkner, Pulaski and Saline Counties, and expanding within Lonoke County. As a result of this expansion, total area grew from 1,531 square miles to 2,459 square miles. As a result of this expansion, Census 2010 population within CARTS grew from 621,371, or 88.8 percent of population within the six-county Little Rock-North Little Rock-Conway Metropolitan Statistical Area, to 659,498, or 94.2 percent of regional population.

In 2000, the Little Rock-North Little Rock Urbanized Area had a population of 360,331, and in 2010, it was 431,388. This is a 20 percent increase in ten years. In the aftermath of Census 2010, Conway also became an urbanized area, with a population of 65,277. This included portions of Mayflower and adjacent unincorporated portions of Faulkner County. There were also urban clusters in Maumelle, Lonoke, England, and Ward.

Table 1 on the following page shows the change in population by city and county from 2010 to 2013, based on Metroplan estimates. The fastest growth was in Faulkner County, which grew by 5.5 percent. Second-fastest was Saline County, which grew by 5.4 percent, followed by Lonoke County (3.1 percent), and Pulaski County (2.0 percent). The fastest-growing city was Bryant, which grew by 12.4 percent.

Housing

The region's nine largest cities issued building permits for 2,868 new housing units in 2012. This was an increase of 4 percent over 2,756 units in 2011. New single-family permits increased 24.6 percent from 2011 to 2012. New multi-family permits declined 12.1 percent. Little Rock issued the most single-family permits, with 395, followed by Benton (210) and Conway (187). In multi-family permits, North Little Rock was the leader with 488, followed by Cabot (308) and Little Rock (275). The single-family, multi-family, and total housing unit permits can be seen for 2002-2012 in Table 2 through Table 4, respectively, and is illustrated graphically in Figure 2.

Employment

Table 5 gives a general overview of the labor force in the four-county area (Faulkner, Lonoke, Pulaski, and Saline) from 2002 to 2012. The labor force grew by about 11.5 percent over this period, while the number of employed persons grew more slowly, by about 8.8 percent, during the same years. The unemployment rate rose from 4.8 percent in 2002 to 7.0 percent in 2010 and 2011, then declined to 6.5 percent in 2012. The rapid rise in unemployment during the years 2009-2010 can be attributed to the Great Recession, from which the local and U.S. economies were recovering by 2012.

Figure 3 shows that, while local unemployment for 2010 reached its highest level since at least the early 1990's, it remained lower than state and U.S. averages. During the interval 2009-2010, there were nonetheless major job losses in the local manufacturing, construction, and transportation and warehousing industries. The central Arkansas region has historically tended to lag national economic recessions, but also to emerge from them more slowly than average. In line with this tendency, local job growth was slow during 2011, and only slightly faster than in 2012. Total employment in 2012 was 342,400, or still 1.6 percent below its pre-recession peak of 347,900 in 2008.

Vehicle Registration

Motor vehicle registration increased by 17.03 percent, or 82,373 vehicles, between 2001 and 2010, whereas population increased by 87,614 (15.0 percent). Figure 4 depicts vehicle registration between 1997 and 2010.

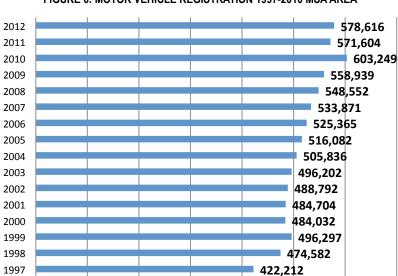

FIGURE 6: MOTOR VEHICLE REGISTRATION 1997-2010 MSA AREA

Table 7 presents the mix of registered motor vehicles 1997-2012 by county. The region as a whole saw a decline in registrations after 2010, probably reflecting the late impact of the Great Recession in Central Arkansas. All counties saw a decline in vehicle registrations during this period. The greatest decline was in Lonoke County (-7.5 percent) followed by Pulaski County (-4.9 percent). The decline was least in Faulkner County (-1.0 percent) and Saline County (-2.0 percent). Over the longer term, in the five years from 2007 to 2012, all counties showed growth. Figure 7 shows the breakdown of motor vehicles by vehicle type.

Congestion Management Process

In 1996, Metroplan initiated the Congestion Management System (CMS); however, the CMS has since been renamed the Congestion Management Process (CMP). Metroplan staff annually drives specific roadway segments to measure how much time is required to travel the segment. Times are compared by determining delay rate, which is the difference in the expected time to travel at the posted speed limit without stopping divided by the length of the segment compared with the actually travel time. Roadways are classified as congested when the delay rate exceeds .41 minutes per mile (min/mile) for arterials and .20 min/mile for freeways. On arterials, this is the equivalent of traveling at 40 mph when the posted speed is 55 mph. For freeways, this is the equivalent of traveling at 50 mph when the posted speed is 60 mph. The roadway segments are then rated to give some idea of how each one measures up. CMP runs are only conducted on roadway segments on the Regional Arterial Network (RAN) and area freeways. The CMP routes were not analyzed in the fall of 2010.

arkRide

arkRide is a free ride matching service provided by Metroplan, in partnership with its local jurisdictions, AHTD, CATA, and the Arkansas State Employees Association. arkRide allows users in the central Arkansas area to visit the arkRide website to find carpool service, vanpool service, transit partners, bike partners, and/or walk partners. AHTD provides 12 Park and Ride lots throughout the CARTS area, which can be used by carpoolers and vanpoolers. In August of 2011, arkRide had 53 active users registered on arkRide. com with over 172 requests for matches in the previous year.

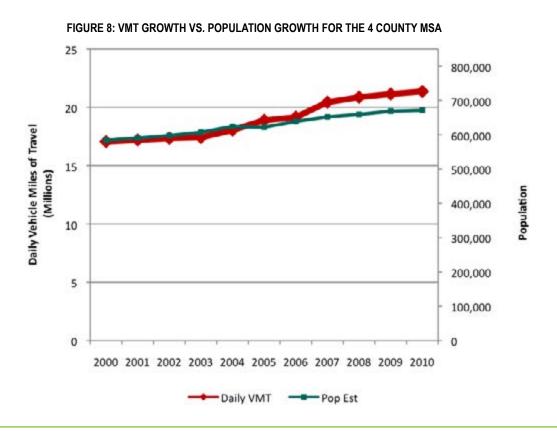

Commuting

The location of home and work is an essential element of transportation planning. The information presented in Table 7 reflects place of residence for persons employed in the CARTS area. Since Faulkner and Lonoke Counties were added to the MSA following the 1990 decennial census, the 1980 census data does not include discrete data for commuters in these counties. The 2008 commuter data show that Pulaski County remains the county with the largest number of incoming commuters. In 2008, 52,635 people commuted to Pulaski County from Faulkner, Lonoke and Saline Counties, an increase of 13 percent from 2000. Commuters from Lonoke County driving to Pulaski County to work increased 25 percent between 2000 and 2008. Commuters from Faulkner and Saline Counties to Pulaski County increased 10 percent and 7 percent, respectively.

In 2009, 33,560 people lived and worked in Faulkner County, which is up from 28,092 in 2000. Saline County saw a 29 percent increase in the number of workers remaining in the county and Lonoke County an 11 percent increase.

Vehicle Miles of Travel

The estimate of total vehicle travel is stated in terms of daily vehicle miles of travel (DVMT). Table 9 compares estimated daily VMT figures between 2002 and 2010. There has been a 23 percent increase in

DVMT since 2002. Between 2002 and 2009, VMT increased on local roadways by 47 percent, compared to 45.5 percent for freeways/expressways (non-interstate); while interstate VMT only increased by 16 percent.

Figure 8 compares the DVMT growth to the population growth between 2004 and 2012 for the four county MSA. The DVMT for the MSA area grew 25 percent, while the population only grew 15 percent.

Air Quality

FY 2011 was marked by significant uncertainty with respect to the region's future air quality status. Proactive air quality efforts included – continuation of the Ozone Action Days program and a consultant-led ozone awareness campaign, continued participation in the Arkansas Clean Cities Coalition, publication of a Regional Green Agenda, and interagency coordination of a MOA to prepare for the possibility that the Clean Air Act's (CAA's) "transportation conformity" provisions may be applied to the CARTS planning process.

National Ambient Air Quality Standards (NAAQS) Compliance Ground-Level Ozone-

Arkansas Governor Mike Beebe submitted a letter on March 10, 2009, recommending that Crittenden and Pulaski counties be designated nonattainment areas based on the latest three years of quality assured ozone monitoring data then available (2006–2008). However, on September 16, 2009, the U.S. Environmental Protection Agency (EPA) suspended implementation of the ozone standards that had been issued in 2008. Those NAAQS had been promulgated by the previous EPA Administrator over the objection of the EPA's science advisors (i.e., the Ozone Review Panel of the Clean Air Scientific Advisory Committee or CASAC), which had unanimously recommended that the "primary" (health-based) standard be set within a range of from 0.060 to 0.070 parts per million. Federal court action ensued which resulted in EPA reconsidering the 2008 ozone NAAQS.

On January 6, 2010, EPA proposed to lower the "primary" (health-based) eight-hour ozone NAAQS to a level within the range of 0.060-0.070 parts per million (ppm), and also proposed a new "secondary" (welfare-based) NAAQS to protect sensitive vegetation and forested ecosystem from the adverse effects of cumulative ozone exposures.

If the 2009-2011 ozone monitoring data is used by EPA when designating "nonattainment areas," Central Arkansas would lose its clean air status, assuming the "primary" ozone NAAQS were lowered to a range of 0.060 to 0.070 ppm (refer to Figure 7 and Figure 8).² However, if future ozone seasons are as mild as 2008 and 2009, the three year ozone averages might be low enough to comply with a "primary" NAAQS set at 0.070 ppm. On the other hand, this analysis does not consider the risk of failing to comply with

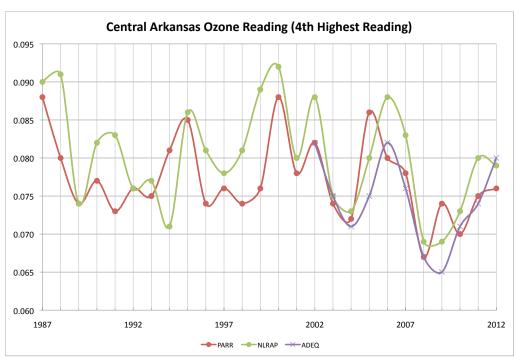

FIGURE 10: OZONE NAAQS MONITORING TRENDS IN CENTRAL ARKANSAS ANNUAL 4TH HIGHEST 8-HOUR DAILY MAXIMUM IN PARTS PER MILLION, 1987-2012*

Sources: U.S. Environmental Protection Agency and Arkansas Department of Environmental Quality.

¹In an April 7, 2008 letter to the EPA Administrator, the CASAC Ozone Review Panel had advised ...your decision to set the primary ozone standard above this range fails to satisfy the explicit stipulations of the Clean Air Act that you ensure an adequate margin of safety for all individuals, including sensitive populations.

a new "secondary" ozone NAAQS, nor does it consider the impact of future emissions reductions that are likely to result from other federal regulatory actions that have already taken place.³ The EPA has postponed the final ruling of the eight-hour ozone NAAQS standards into FY 2012.

Particulate Matter-

The CARTS area has always been in compliance with the particulate matter standards (i.e., both the coarse "PM10" and fine "PM2.5" particulate matter). However, during FY 2010 EPA and the CASAC's Particulate Matter Review Panel continued the required review of the 2006 PM NAAQS. The Policy Assessment, published by EPA in April 2011, provided general recommendations for consideration of lower PM standards, but did not finalize any of the recommendations

Greenhouse Gases

Although new national policies to reduce greenhouse gas (GHG) emissions were considered in the 111th Congress during FY 2010,4 no legislation was passed. Concurrent with the Congressional inaction, issued an "Endangerment Finding" that six key, well-mixed GHGs represent a threat to the public health and welfare of current and future generations. This finding allows EPA to regulate GHG emissions (or rather their carbon dioxide (CO2) equivalents) collectively as a "criteria" air pollutant under the CAA. EPA also issued a "Cause or Contribute Finding" that the combined GHG emissions from new motor vehicles and engines contribute to the atmospheric concentrations of the key GHGs, and hence to the threat of climate change. Legally buttressed by these findings, on September 28, 2009, the U.S. DOT and EPA jointly proposed to establish Light-Duty Vehicle Greenhouse Gas Emission Standards and Corporate Average Fuel Economy Standards through 2016 that were scheduled to be finalized by the end of 2010. In addition to requiring large industrial facilities⁵ to begin monitoring and reporting their GHG emissions yearly, EPA proposed that when these large emission sources seek construction and operating permits in accordance with the CAA to build or significantly modify their facilities, they must demonstrate the use of best available control or retrofit technologies (BACT or BART) to minimize GHG emissions. The impact of BART regulations on the planned installation of "dry SO2 scrubbers and low NOX equipment" at the White Bluff coal-fired power plant near Redfield were uncertain as the fiscal year ended.⁶

Proactive Efforts

In addition to monitoring and reporting central Arkansas' air quality status, various participating agencies coordinated via staff, consultants, advisory committees, and working groups, to undertake the following proactive air quality planning and public education activities during FY 2010.⁷

Ozone Action Days

Ozone Action Days (OAD) is an interagency program established in 1997 to increase public awareness of the health risks associated with ground-level ozone exposure and to encourage voluntary emissions reduction actions to help keep central Arkansas in attainment of NAAQS. From May through September of each year,

the Arkansas Department of Environmental Quality (ADEQ) issues a daily ozone forecast. In FY 2011, the ozone season and daily forecasting were extended through October, rather than September, due to

⁵These include the nearby White Bluff power plant near Redfield, AR, and the not so distant Independence power station near Newark, AR. Each Entergy operated power plant has two 850 megawatt capacity generators and two coal-fired boilers which together emitted a total of 22.45 million tons of CO2 in 2005 (Source: EPA's eGRIDweb).

⁶Although the proposed retrofit equipment would comply with EPA's Clean Air Visibility Rule and allow the White Bluff plant to operate beyond September 2013, the installation of the dry SO2 scrubbers would not reduce CO2 emissions, but would reduce NOX emissions that could potentially contribute to ozone formation although perhaps not as much as "wet" scrubber would (refer to METRO 2030.2, Section 13: Air Quality).

Refer to the Proactive Efforts section in Section 13: Air Quality of METRO 2030.2 (posted at www.metroplan.org).

unseasonably high ozone levels. Metroplan and the other OAD participating agencies continue to use a variety of methods to disseminate OAD advisories to area motorists, news media, employers, and other organizations.

In order to educate the general public, especially weekday commuters, Metroplan's OAD consultant carries out an ozone awareness campaign involving both paid and earned media coverage. The radio advertising campaign mainly used radio disc jockey ad-libs to provide the daily ozone forecast and encourage voluntary actions to help reduce ozone formation and minimize ozone-related health risks. To sign up for EPA's EnviroFlash email notifications and for other information, radio listeners were directed to visit the OAD website, www.ozoneactiondays.org. In addition, the OAD consultant assisted with the coordination of the 2011 Ditch the Keys event, which occurred in May of 2011. Ditch the Keys was a joint effort between multiple municipalities and Metroplan to kick off the ozone season by encouraging citizens of central Arkansas to ditch their keys and seek an alternative mode of transportation to work, including bicycling or transit.

In addition to providing Congestion Mitigation and Air Quality Improvement (CMAQ) funds for the OAD awareness campaign, the AHTD used their variable message boards along area freeways to notify motorists of OAD advisories. Metroplan continues to maintain the OAD website, report OAD website usage statistics, manage OAD consultant services, and coordinate OAD fax broadcasting notifications to the local news media and other organizations. The National Weather Service continues to include OAD advisories in their weather radio advisories. Various participating organizations continue to publicly display the "Ozone Action Days Alert" flag during OAD episodes; while some agencies took other proactive measures to encourage ozone awareness and actions to reduce health risks and emissions.

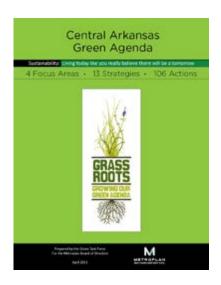

Clean Cities

Clean Cities is a U.S. Department of Energy and participant-sponsored public-private partnership to reduce petroleum consumption in the transportation sector by advancing alternative fuels and vehicles, idle reduction technologies, hybrid electric vehicles, fuel blends, and other measures.

Metroplan, the AHTD and other CARTS agencies continue to participate in the renamed "Arkansas Clean Cities Coalition" following the transfer in early 2009 of the Clean Cities host agency function from Metroplan to Winrock. During FY 2010, Winrock tried to broaden Clean Cities participation statewide by hosting or coordinating various meetings including an August 2009 Clean Cities Stakeholders meeting.

Green Agenda

Efforts to develop a Regional Green Agenda were formally initiated by Metroplan in 2009, at the direction of the board of directors. The Green Task Force is comprised of staff and volunteer representatives from member governments and meets on a monthly basis to guide the development of the Green Agenda. The mission of the Green Task Force is to be a leader in central Arkansas empowering communities to develop a more sustainable environment. During 2010, Metroplan staffed the Green Task Force and led a large-scale public outreach campaign, Grass Roots: Growing Our Green Agenda. The purpose of the public outreach campaign was to engage new audiences in new ways in the conversation about what should be addressed in a regional Green Agenda for central Arkansas. Over 1,000 people participated in focus groups, a youth summit, and a variety of social media tools over a 6-week period. The feedback from citizens was

integrated into the fabric of the Regional Green Agenda, which is structured around four categories: movement, power, nature, and knowledge. The Regional Green Agenda was published in 2011 and can be accessed through the Metroplan website.

Transportation Plan

In order to reflect changing environmental, regulatory and programmatic concerns, the scheduled minor update of the long-range metropolitan transportation plan, METRO 2030.2 (posted at www.metroplan. org), included an update to "Section 13: Air Quality" that for the first time included information about greenhouse gases and a historical overview of ozone regulations from a local perspective.

Transportation Conformity and Interagency Coordination

Longstanding uncertainty about the region's ozone air quality status motivated a multi-year effort to draft a memorandum of agreement (MOA) for interagency consultation in the event that the region failed to attain the ozone NAAQS. After the EPA formally proposed to lower the "primary" (health-based) NAAQS to a level within the range of 0.060-0.070 ppm, the CARTS Air Quality (CARTSAQ) Planning Group completed drafting the MOA. The draft MOA lays out the interagency consultation procedures required by Section 110 of the CAA that would be used to assure that the metropolitan transportation plan and transportation improvement program conform to the purpose of the State Implementation Plan (SIP) for air quality control. Transportation conformity requirements would significantly impact the CARTS planning process, because many, if not most, transportation projects contained in the transportation plan and TIP would have to come from a "conforming" plan and TIP. Conformity with the SIP would be determined through detailed documentation of regional planning assumptions, transportation system modeling, and regional emissions analysis that would have to be approved by both EPA and FHWA.

Components of the Transportation System

The local transportation system consists of personal transportation components; including streets and highways, private vehicles, public transportation, walkways, bikeways and airplanes; and the goods movement systems; including the trucking industry, rail systems, air freight, pipelines and waterways. The following is a brief discussion of these system components.

Streets and Highways

Local roadways represent the largest governmental investment in the transportation system and provide the highest level of mobility that exists in the urban area. The following table is the 2013 estimate of local roadway, state/US highway and interstate mileage for each jurisdiction within the CARTS area.

TABLE 10: 2010 ROADWAY MILEAGE BY JURISDICTION

Jurisdiction	Local	State	Interstate / US Hwy	Total

Walkways and Bikeways

The CARTS area is home to numerous walkways and bikeways, including nearly 100 miles of bikeways and over 625 miles of sidewalks. The exact mileage is broken down in Table 11.

TABLE 11: CARTS WALKWAY AND BIKEWAY MILEAGE 2011

	Shared Path	Bike Lanes	Total
Bikeways	86.53	48.05	134.58
Sidewalks (Includes Shared Path Mileage)			1270.98

One of the most notable features of this system is the Big Dam Bridge in Little Rock. Built in 2006, the Big Dam Bridge is the longest bicycle/pedestrian bridge built explicitly for bicyclists and pedestrians. The Big Dam Bridge connects nearly 17 miles of the River Trail in Little Rock and North Little Rock, which is another defining feature of the walkway and bikeway system. At the end of FY 2011, two new additions to the River Trail System were under construction, the Two Rivers Bridge and the Rock Island Railroad Bridge. Maps of the sidewalks and bike paths in the CARTS area are shown in Figure 9 and Figure 10, respectively. With the increased focus on developing a more sustainable region, these walkways and bikeways are becoming a vital element of the CARTS area transportation system.

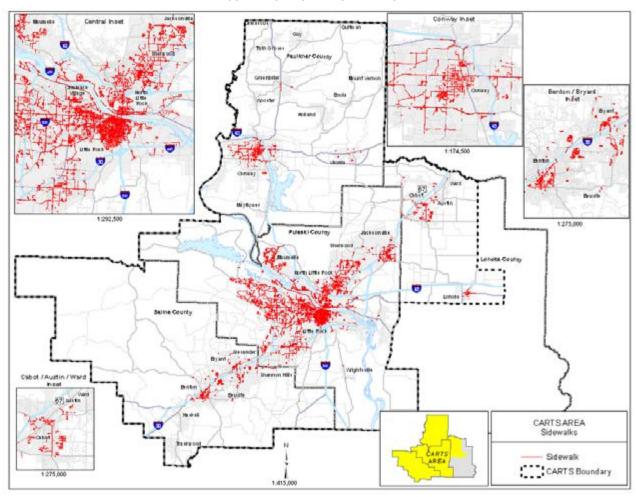

FIGURE 11. CARTS AREA SIDEWALKS

Crash Data

Beginning in 2000, Metroplan started collecting annual crash data from the Arkansas State Police for the four-county area. These data are useful in determining the safety of our roadway system.

Table 13 shows the total number of crashes by severity in the four county area by year. The total number of reported crashes has decreased from 18,567 in 2005 to 18,061 in 2009. The total number of fatalities also decreased from 103 in 2005 to 102 in 2009. Table 14 through Table 18 shows the number of crashes by severity by year and county.

Not only is it important to consider vehicular crashes, it is also important to consider crashes involving pedestrians and bicyclists. Table 12 shows the number of pedestrians or bicyclists involved in crashes in the MSA for 2007 through 2009.

Set of Pages County

Between 2007 and 2009, a total of 575 pedestrians or bicyclists were involved in crashes with vehicles resulting in 44 fatalities, up from 29 in 2004 to 2006. The total number of pedestrian/bike crashes is down 1.7% from 585 crashes between 2004 and 2006. Crashes involving pedestrians increased from 402 crashes between 2004 and 2006 to 422 crashes between 2007 and 2009. Crashes involving bicyclists declined 16.4% from 183 crashes in 2004-2006 to 153 crashes from 2006-2008.

Signal Inventory Data

Given the importance of signalized intersections to the operation of the transportation system, Metroplan periodically updates the inventory of traffic signals within the CARTS area. During 2010, CARTS area jurisdictions participated by providing requested signal data to update the previous signal inventory conducted during 2008. These data were assembled, tabulated, reviewed and included in the CARTS GIS. The location of traffic control signals inventoried in 2001, 2004, 2006, 2008, and 2010 plus those currently planned are illustrated in Figure 11. The following table provides a summary of the traffic signal inventory.

TABLE 24: 2010 CARTS TRAFFIC CONTROL SIGNAL INVENTORY SUMMARY

⁵ New to CARTS Area

Regional Arterial Network (RAN)

The regional arterial network is designed to provide feasible alternatives to the area freeway network for intra-regional travel within central Arkansas. Figure 12 below depicts the RAN. In 2002, the RAN Study was completed by consultants and identifies short, mid, and long term strategies that ensure a high level of mobility on priority corridors, critical segments, and critical bridges of the RAN. The report ranks projects based on a technical scoring system that includes factors such as traffic volumes, safety, cost effectiveness, and community impact. Construction projects from this study will be implemented through the Transportation Improvement Program (TIP) and included in METRO2030 and METRO 2030.2. An update of the RAN Study is scheduled for publication in early FY 2012.

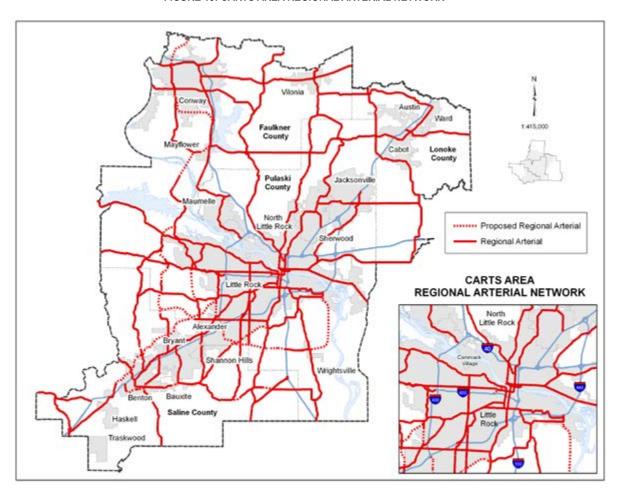

FIGURE 13: CARTS AREA REGIONAL ARTERIAL NETWORK

Central Arkansas Transit Authority (CATA)

Public transit in central Arkansas is chiefly served by the Central Arkansas Transit Authority (CATA). CATA provides fixed route, specialized (paratransit), and trolley transportation in Pulaski County. CATA has a total of 82 buses and paratransit vans, all of which are lift-equipped, which is up from 73 in 2006. Table 25 describes the type, year, and average fleet age for CATA's rolling stock.

TABLE 25: CATA'S ROLLING STOCK

	Bus

Source: CATA

Figure 13 shows annual ridership for the three modes of transportation provided by CATA. The fixed route service has the most riders primarily because the other two modes are very specialized. In 2005, the River Rail experienced a spike in ridership, which is due to the increased interest in the system after its opening in 2004. The River Rail has seen very little fluctuation in ridership since 2006. The fixed route service saw an 20.5% jump in ridership from 2009–2012.

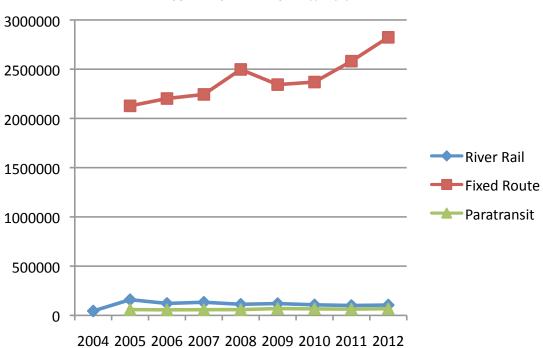

FIGURE 14: CATA RIDERSHIP 2004-2010

CATA is governed by a twelve member Board of Directors appointed by the local governments of Little Rock, Maumelle, North Little Rock, Pulaski County and Sherwood. Personnel include 199 full-time and 1 part-time employees. The 2013 operating budget is \$16.8 million which includes \$1.9 million for paratransit and \$1 million for River Rail. The total operating budget has increased nearly \$5.8 million since 2006, which includes \$0.6 million increase for paratransit and \$0.5 million increase for River Rail. Funding for the operating budget comes from farebox revenues (\$2.2 million), local government dues (\$11.8 million), and federal/ miscellaneous funds (\$2.7 million). CATA operates 49 buses in peak-hour service, on 22 regular fixed routes, four express routes, a demand-responsive service (Links paratransit), and 5 River Rail streetcars (3 in peak hour service and 5 total).

The River Rail Vintage Streetcar project was completed in 2004. The first phase of River Rail operated on 2.5 miles of track in Little Rock and North Little Rock. The route uses President Clinton Avenue and Second Street between Spring and River Market Avenue, and Third Street between River Market Avenue and World Avenue in Little Rock, and Main Street, Seventh Street, Maple Street, and Broadway Street in North Little Rock, with 15 stops along the route.

Figure 14 shows the route of the River Rail. As part of the River Rail Project, CATA constructed a maintenance and storage facility for the trolleys at 100 East Bishop Lindsey in North Little Rock. CATA began with three vintage rail trolley cars, and have since acquired two more. All trolleys are accessible to persons with disabilities and are air conditioned. Phase 2 of the River Rail Project, the .9 mile extension to the Clinton Presidential Library and Heifer International, was completed in February 2007 for a total of 3.4 miles of track in the River Rail system.

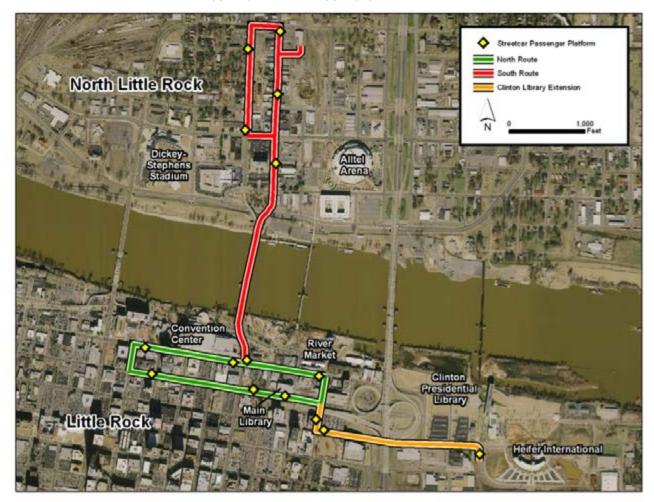

FIGURE 15: RIVER RAIL ROUTE SYSTEM

Airports

There are four general aviation airports and one military airbase located within the CARTS area: Conway Airport, Little Rock Air Force Base, Bill and Hillary Clinton National Airport, North Little Rock Airport, and the Saline County Airport, which are displayed in Figure 1. In addition to these airports, there are several privately owned airports and an airstrip at Camp Robinson, which are all located in the CARTS Area.

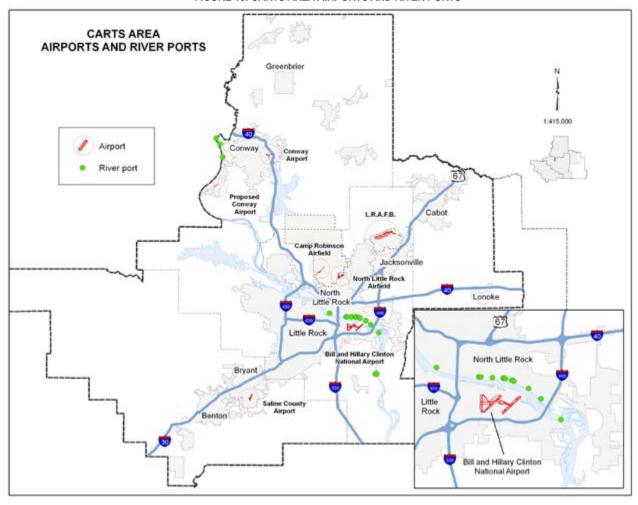

Bill and Hillary Clinton National Airport (Adams Field) is located three miles from downtown Little Rock and encompasses some 1,400 acres. The airport complex includes facilities for public parking, commercial airlines, air cargo, general aviation, and aircraft related business. Bill and Hillary Clinton National Airport is served by six major airlines with non-stop service to 16 airports, which are listed in Table 1.River and Ports

In 2012, total enplanements at Bill and Hillary Clinton National Airport were 2,118,880; marking about a 4.66% increase from the 2011 enplanements. This slight decrease in 2010 was not experienced throughout the US, as the nation saw a 1.9% increase in passengers between 2009 and 2010 according to the Bureau of Transportation Statistics.

FIGURE 16: CARTS AREA AIRPORTS AND RIVER PORTS

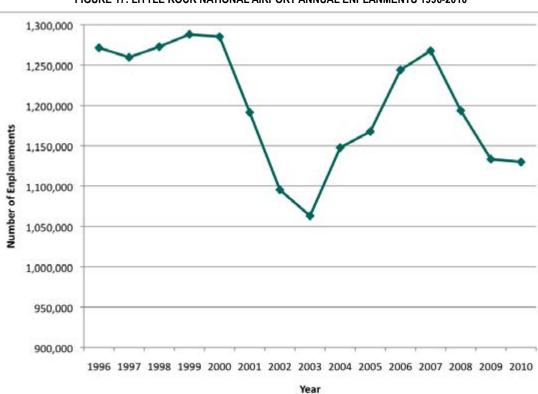

FIGURE 17: LITTLE ROCK NATIONAL AIRPORT ANNUAL ENPLANMENTS 1996-2010

The McClellan-Kerr Arkansas River Navigation System provides a channel from the Mississippi River northwest to Port of Catoosa, fifteen miles east of Tulsa, Oklahoma, on the Verdigris River. The McClellan-Kerr Navigation System was opened in 1969 and consists of eighteen lock chambers that were installed at a cost of \$700 million. These locks lift barges 420 feet along the 448 mile route; individual locking heights vary from 14 to 54 feet. There are three locks located in the CARTS area, Murray Lock and Dam, David D. Terry Lock and Dam, and the Toad Suck Lock and Dam. The navigation system has a minimum depth of nine feet and a width of 250 feet.

Figure 17 shows the amount of tonnage transported on the entire McClellan – Kerr Navigation System by year from 1996 to 2008. The annual amount of tonnage has increased 3.3 percent from 11.7 million in 1996 to 12.0 million in 2008. Major commodity movements on the river include sand/gravel/rock, industrial and energy resource commodities, and others. Figure 18 depicts the percentages of these movements for 2008.

FIGURE 18:COMMODITY SHIPMENTS 1996-2010 MCCLELLAN-KERR ARKANSAS RIVER NAVIGATION SYSTEM

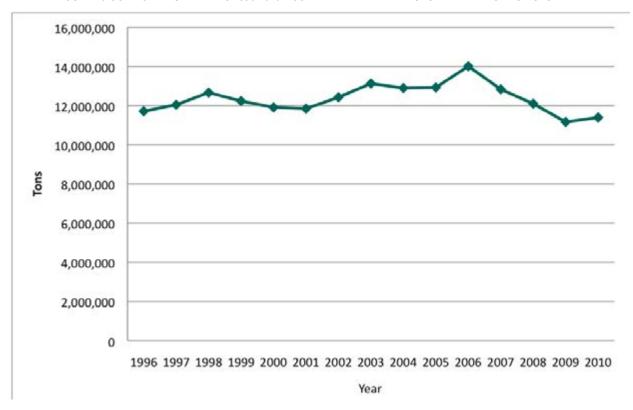

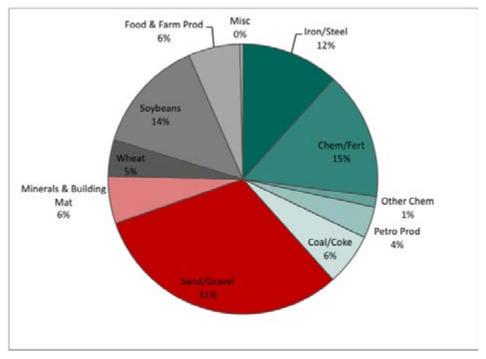

FIGURE 19: TOTAL 2010 COMMODITY SHIPMENTS BY PERCENT MCCLELLAN-KERR ARKANSAS RIVER NAVIGATION SYSTEM

There are 16 public and private ports on the Arkansas River and Cadron Creek in the CARTS area. Table 23 lists the ports in the area by name and can be located geographically in Figure 15

Little Rock Port

The Little Rock Port is the largest port in the area with 1,500 acres. The port includes industrial and warehousing development along with intermodal operations among rail, truck, and barge. Industrial activities that involve truck and rail access currently predominate, although barge related activity exists as well.

The Little Rock Port Authority Railroad serves 40 major industries in the Port Industrial Park. The Little Rock Port Railroad also provides service for 60% of the cargo that travels through the river terminal on 12 miles of main line track. In 2010, the Little Rock Port Authority Railroad handled 6,818 cars. Figure 19 shows the annual number of cars handled from 1996-2010. The increase in volume of cars in 2009 may partially be due to Welspun Corporation, an India-based pipe manufacturer, opening a 740-acre manufacturing facility adjacent to the Little Rock Port Authority. In 2010, Revolution Bag, a new subsidiary of Delta Plastics, started manufacturing trash bags from recycled materials in the Port Authority Industrial Park. This new production, along with continued growth of existing facilities in the complex are potentially cause for the increase in rail cars handled by the Port Authority Railroad in 2010.

FIGURE 20: CARS HANDLED ANNUALLY LITTLE ROCK PORT AUTHORITY RAILROAD 1996-2010
*Reflects Burlington Northern Santa Fe (BNSF) blocking. LR Port Authority makes up trains for BNSF.

2011: 6,280 (6,680*) 2012: 6,145 (5,870*) Car Foreign Trade Zone-14 is located in the Port Authority Industrial Park. A Foreign Trade Zone (FTZ) is a site within the United States, in or near a US Customs port of entry, where foreign and domestic merchandise is generally considered to be in international commerce. The United States Congress created this program to stimulate international trade and thereby create jobs and investment in the US rather than abroad. The advantage to having a Foreign Trade Zone is that imported goods can be stored or processed without payment of US Customs duties until the goods are moved out of the zone at the point of retail. Little Rock is also a US Customs Port of Entry for freight and passengers with immigration officials on call.

There is extensive truck activity related to the port and adjacent industrial/warehousing operations. Truck access is provided via Fourche Dam Pike and Lindsey Road interchanges with Interstate I-440. Both of these roads have at-grade crossings with the port railroad.

Railroads and Trucking

Both Union Pacific (UP) and Burlington Northern Santa Fe (BNSF) Railroads provide service to the CARTS area. However, only Union Pacific has infrastructure within the CARTS area. Union Pacific's operational hub in Arkansas is located in North Little Rock. North Little Rock is home to the \$40 million Downing B. Jenks Locomotive Repair Shop, the largest in UP's system, and the second largest freight car classification yard in UP's system. The railroad classification yard processes approximately 1,200 cars per day. Each of the railroad lines in the area is a part of one of four subdivisions in central Arkansas, which can be seen in Figure 20.

FIGURE 21: CARTS AREA UNION PACIFIC RAILROAD LINES

Because the operational hub is located in North Little Rock, Union Pacific has the most miles of track in Pulaski County, with 66, followed by Saline, Faulkner, and Lonoke for a total of 120 miles. Annually, nearly 90 million gross ton-miles are shipped through the CARTS area by rail. Table 24 summarizes this data and shows the average daily train counts on each subdivision in the CARTS area.

Central Arkansas Regional Transportation Study 2012

TABLE 28: UNION PACIFIC RAILROAD ROUTE MILES AND SHIPMENTS IN THE CARTS AREA

County	Subdivision	Station	Station	Milepost	Milepost	Miles	Average Daily Train Counts	Average Annual Ton-Miles (millions)

Source: Union Pacific Railroad

The railroad lines run through several densely populated areas, particularly in Little Rock and North Little Rock, where grade crossings are very prevalent. Pulaski County contains 212 grade crossings, while the remaining counties have significantly fewer. Many of these grade crossings do not have any warning devices, but some of these crossings may have a grade separation between the railroad and the roadway. Gates, stop signs, and cross-bucks were the other commonly used warning devices in the CARTS area and many of these grade crossings have two types of warning devices. The number of grade crossing warning devices is listed by county in Table 25.

TABLE 29: CARTS AREA RAILROAD GRADE CROSSING WARNING DEVICES

County	None	Stop Signs	Flashers	Xbucks	Xbucks/Stop Signs	Xbucks/Yield Signs	Cants	Gates	Gates/Cants	Bells	Total

Faulkner	5	8	2	0	9	0	1	16	2	0	43
Total	107	36	18	23	31	1	4	91	14	1	326

The CARTS area is served by five major interstate highways: I-30, I-40, I-430, I-630, and I-440. I-30 and I-40 both serve as major commercial routes carrying significant truckloads through the area. The remaining three interstates serve as connectors between I-30 and I-40. In addition, I-440 serves the Little Rock Port Authority and industrial area near Little Rock, which encourages additional truck traffic.

There are more than 60 franchised motor carriers in the CARTS area. These motor carriers provide regular route, common carrier service to destination points across the United States. Each motor carrier has local freight terminals providing daily delivery, pick-up, and drop-ship service.

Pipelines

Pipeline transportation uses transmission pipelines to transport products such as crude oil, natural gas, refined petroleum products and slurry.

Arkansas' flowable bulk system consists of natural gas, oil and product pipelines. Several large fuel storage terminals are linked to refineries by pipelines. The central Arkansas pipeline/fuel storage complex is located in North Little Rock on Central Airport Road. Figure 21 shows the location of the central Arkansas pipeline/fuel storage complex and Arkansas pipelines.

FIGURE 22. PIPELINE CORRIDORS AND FUEL STORAGE TERMINAL

Improving Area Mobility

The transportation system serving the CARTS are can be described primarily as privately owned vehicles operating on transportation facilities provided with government assistance. Because area mobility is so dependent on an adequate and safe roadway system, the traditional emphasis of the CARTS effort has been directed towards traditional roadway improvements. New efforts are being made in the areas of ITS, pedestrian and bikeway facilities and transit.

METRO 2030.2

The Metroplan Board adopted METRO 2030.2 in March of 2010. Due to several uncertainties related to air quality and transportation legislation, this plan is only a revision of METRO 2030, rather than a full five year plan update. METRO 2030.2 revisits, updates, and expands information and data for several fundamental sections of METRO 2030. METRO 2030.2 is different from the previous long range transportation plans in that it includes several new elements, such as a section on "transportation and health."

Transportation Improvement Program (TIP)

The TIP is the tool by which projects identified in the long-range transportation plan may be advanced. It is the short-range program of transportation improvements for the CARTS area. Although the TIP identifies all area transportation improvements funded with US Department of Transportation assistance as a federal requirement, the CARTS TIP also includes many other projects funded by local sources to fully describe the extent of local transportation investments.

Intelligent Transportation Systems

Intelligent Transportation Systems (ITS) use information and communication technology to improve the traffic flow, mobility, economic vitality, safety, environmental impacts, and services provided to travelers. The CARTS area ITS plan was developed in the early 2000s, adopted in June of 2002, and was updated to reflect changes in the CARTS area and advanced technology in October of 2010. The CARTS ITS plan focuses on regional travel information systems, freeway and incident management systems, transit management systems, advanced traffic control systems, and highway rail intersections. These specific application areas should allow the capacity of the existing system to be maximized.

Street Fund Accounts

Revenue sources vary between jurisdictions. Expenditures also vary from jurisdiction to jurisdiction, but the basic categories include, personnel, maintenance and operations and capital outlays.
